Creating tagged PDF

A simple demonstration how to create tagged document. Above is the tagged logo of TallComponents and a tagged heading. Next are some more examples for MultilineTextShape and SimpleXHtmlShape.

MultiLineTextShape can be tagged as a Shape. In this case all fragments in the shape will be under one Tag.

Or each Fragment in the MultilineTextShape can be tagged. In This case all Fragments will have their own Tag.

A SimpleXhtmlShape is going to be **tagged** based on the html content.It means, each Xml element will have **its own** Tag.
